

## NOTICE OF COVERAGE

### FOR NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) STORM WATER DISCHARGES FROM CONSTRUCTION ACTIVITY

By Authority of R 323.2190 promulgated under Part 31 of Act 451, Public Acts of 1994, as amended

Failure to comply with the terms and provisions of R 323.2190 may result in fines up to \$25,000

per day and the possibility of imprisonment.

<b>FOR DEQ USE ONLY</b>	
NPDES Number	
MIR111690 <sup>(E)</sup>	
Receipt No.:	
11-15034	
Permit Id:	
91545	

signed 3/29/11

Filing of this Notice of Coverage (NOC) with the Michigan Department of Environmental Quality (MDEQ) is required before initiation of construction activities **that disturb 5 acres or more of land or is part of a larger common plan of development or sale** that requires a national permit pursuant to the provisions of 40 CFR Section 122.26(a). This constitutes notice that the construction permittee is authorized under R 323.2190 to discharge storm water associated with the construction activities. The construction permittee must be the land owner or the recorded easement holder of the property where the construction activity is located.

**INSTRUCTIONS AND FEE INFORMATION:** Soil Erosion and Sedimentation Control (SESC) coverage is required under Part 91, SESC, of Act 451 before submitting this NOC. The construction permittee will be deemed to have an NPDES permit for storm water discharges from a construction site when the MDEQ receives the completed NOC, **a copy of the appropriate SESC permit, a copy of the approved SESC Plan, a site map and the \$400 fee.** These must be received before construction begins. **This authorization to discharge construction storm water will expire** on the same day as the SESC permit originally submitted to the MDEQ with this package. The expiration date will be specified in the NOC acknowledgement letter provided by the MDEQ (please make sure you receive the NOC acknowledgement letter). NOC Authorization to discharge storm water may be extended (up to five years after original issuance date) by submitting a NOC Renewal form and a copy of the revised or extended SESC permit to the MDEQ **prior** to the NOC expiration. If the SESC permit number changes, expires, is revoked or terminated, prior to the complete stabilization of the site, a **new** administratively complete NOC and all the requirements, including the fee must be submitted to obtain storm water authorization.

**PERMIT BY RULE REQUIREMENTS:** The permittee must abide by the requirements of R 323.2190 which states in part: (a) Not directly or indirectly discharge waste materials into the waters of the state in violation of Part 31, Water Resources Protection, of the Act or rules promulgated there under; (b) Be in compliance with a soil erosion and sedimentation control permit for the site; (c) Properly maintain and operate the soil erosion control measures; (d) Have the soil erosion control measures under the specific supervision and control of a storm water operator who has been certified by the Department; (e) Cause the construction activity to be inspected by a certified storm water operator once per week, and within 24 hours after every precipitation event that results in a discharge from the site. Refer to R 323.2190 for the complete listing of requirements at: [http://www.michigan.gov/deq/0,1607,7-135-3313\\_3682\\_3716-23997-,00.html](http://www.michigan.gov/deq/0,1607,7-135-3313_3682_3716-23997-,00.html).

## Soil Erosion and Sedimentation Control Permit

Permit Number 123-08 Date Issued 12-01-08 Expiration Date 12-31-11

Name of Permittee: Kennecott Eagle Land, LLC- John C. Cherry, P.E.  
Address: 594 Spruce St., Ishpeming, MI 49849  
Telephone Number: 486-1257

Location of Project: Address: 4547 CR 601 REPUBLIC/M95  
T 47n R 29w Sec. 29 Humboldt Twp

Permitted Earth Change Activity: [Commercial]

Excavation/fill (approx. 14 acres) necessary for demolition and remediation activities at the **Humboldt Mill Facility**.

Lake/Stream Near Site: n/a

Contact on-site: landowner  
Telephone Number:

### **SPECIAL PERMIT CONDITIONS**

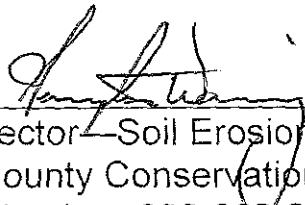

1. As noted on application, silt fencing will be properly installed upon start of work between construction site and lake/stream to prevent sedimentation of waterway. Site visits may reveal the need for additional temporary or permanent erosion control measures.
2. Controls to remain until final grading and site restoration.
3. Heavy hay mulch cover to be used on all raw soils upon restoration.
4. Permittee shall notify the permitting agency within one week after completing the permitted activity or one week prior to the permit expiration date, whichever comes first.

Please post permit to aid in finding remote sites

**Issuance of this permit does not waive the need to obtain other local, state, or federal permits. Of particular importance are state MDEQ permits that cover work in or adjacent to lakes/streams [Part 301], wetlands [Part 303], and floodplains [Part 31]. Contact Michael Smolinski at 906-346-8562 for MDEQ permit information and applications.**

This permit is issued under the provisions of Part 91, Soil Erosion and Sedimentation Control, of the Natural Resources and Environmental Protection Act, Act 451 of the Public Acts of 1994, being Sections 9101 to 9123

The project shall be completed in accordance with Part 91 and the plans and specifications that are part of this permit **(including special conditions and attached general construction/condition requirements.)** A complete copy of this permit must be kept at the project site and available for review. For information regarding the issuance of this permit or the plans and specifications contact:

Kennecott Eagle Lands, LLC  
John C. Cherry, P.E.  
504 Spruce St.  
Ishpeming, MI 49849

Mr. Cherry:

Enclosed please find Soil Erosion and Sedimentation Control (SESC) **Permit #123-08** for your Humboldt Mill Facility project. The information supplied with the application was for demolition and remediation at the site only. Please be advised that future site work associated with the processing facility or any other work at this location can be included in the permit by amendment if received before the expiration date. This will involve submitting another completed Part 91 Permit application for the proposed work. No further fees will be required if the additional work does not exceed the 14 acres covered under SESC Permit #123-08.

Also, please note that I have included a check (#2657) in the amount of \$300 as a refund for overpayment of the permit fee. The fee for 14 acres is \$325 for the first 10 acres (\$3250) and \$250 for the next 4 acres (\$2000) for a total of \$4250. On November 3, 2008, I received check #00028407 in the amount of \$4550 with your Part 91 application.

If you have any questions or comments regarding this correspondence, please do not hesitate to call or email me.

Hampton Waring

## CONSTRUCTION REQUIREMENTS

1. Slope Stabilization:
  - A. Roof gutters/downspouts and/or ground surface protection shall be installed as needed to prevent erosion of the slopes beneath roof driplines and at roof/floor drain discharge points.
  - B. **All disturbed earth surfaces steeper than 3:1 and up to/including 2:1 (horz:vert) shall be restored with pegged sod or erosion control fabric/mats. All disturbed earth surfaces steeper than 2:1 (horz:vert) shall be restored with rock rip-rap or other pre-approved equivalent.**
  - C. No permanent slopes to be created steeper than 2:1 (horz:vert) unless pre-approved.
  - D. All areas on pre-existing slopes steeper than 2:1 (horz:vert) will be permanently stabilized with riprap or other pre-approved equivalent.
  - E. Slopes near retaining walls shall be constructed to convey surface runoff down the slope without causing erosion. Retaining walls constructed of timbers, ungrouted blocks or stones, etc., will be lined with geotextile fabric on the uphill face of the wall to prevent soil from exfiltrating through the wall.
  - F. All sod shall be entrenched such that the top of the sod is to the line and grade of the adjacent ground. The sod seams shall be staggered in the direction parallel to the flow of surface runoff.
  - G. All riprap will be underlain with filter fabric and be large enough not to be displaced during storm events—4-6" minimum is recommended. Front/sides to be trenched into sub-grade.
  - H. All earth changes are to be permanently stabilized with topsoil/seed/mulch to establish a good vegetative surface cover, unless areas are determined by MCCD to be fully self-contained.
  - I. Silt fence shall be properly installed as needed at the downhill perimeter of the exposed soil surfaces to prevent sediment damage to any lake/stream and keep all sediment on-site.
2. In all areas of concentrated water flow for a **25 year/24 hr. storm event**, the soil surfaces shall be armored with the appropriate surface cover material to permanently stabilize the flow line.
  - A. If the flow is between 4 and 6 feet per second, the disturbed earth surfaces shall be armored with pegged sod or erosion control fabric/mats. The sod shall extend a minimum of 1' above the normal depth of flow.
  - B. If the flow is greater than 6 feet per second, the disturbed earth surfaces shall be armored with riprap, pavement, or other pre-approved non-erodible surface. The armor shall extend a minimum of 1' above the normal depth of flow.
  - C. All flow lines with a continuous baseflow shall be permanently stabilized with riprap, pavement, or other pre-approved method (bioengineering is encouraged). The riprap, pavement, etc. shall extend a minimum of 1' above the normal depth of flow.
  - D. Check dams and/or ditch sediment traps shall be installed in flow lines as needed to trap sediment and prevent erosive water velocities.
3. Design, construct, and complete the earth change in a manner that limits the exposed area of disturbed land for the shortest period of time.
4. Install temporary soil erosion and sedimentation control measures before or upon commencement of the earth change activity and maintain the measures on a daily basis. Remove temporary soil erosion and sedimentation control measures after permanent soil erosion measures are in place and the area is stabilized. ("Stabilized" means the establishment of vegetation or the proper placement, grading, or covering of soil to ensure its resistance to soil erosion, sliding, or other earth movement.)
5. All disturbed earth surfaces that are not permanently stabilized with good vegetation or pavement prior to the winter months of each year will be protected with the temporary erosion/sediment controls necessary to prevent erosion into any lakes, streams, or drainage facilities during the winter months and the spring snowmelt/runoff period.
6. Permittee is responsible for the proper installation and timely maintenance of all erosion/sediment controls necessary to prevent erosion/sediment damage to any lake, stream, or drainage facility.
7. Complete permanent soil erosion control measures for the earth change within five calendar days after final grading or upon completion of the final earth change. If it is not possible to permanently stabilize the earth change, then maintain temporary soil erosion and sedimentation control measures until permanent soil erosion control measures are in place and the area is stabilized.
8. Sediment will be removed from runoff water before it leaves the site of the earth change.

9. All flushing, dewatering, pumping, well development, etc., shall be done with no erosion/sediment damage to any lake, stream, or drainage facility. Temporary control measures will be installed prior to these operations to remove sediment and limit the water flow to a non-erosive velocity.
10. Temporary sediment controls shall be installed at all storm sewer and culvert inlets that are downgradient of any exposed soil or gravel surfaces that are a result of this project.
11. Any facility designed/constructed for the control or conveyance of water within, around, through, or from the earth change area will be designed/constructed to limit the flow of water to a non-erosive velocity.
12. Excavations and embankments shall be constructed with positive drainage and/or the drainage facilities necessary to prevent ponding of water and blockage of existing drainage patterns with the exception of constructed wetlands and those facilities specifically engineered for stormwater management. Provisions shall be made to safely convey stormwater runoff down cut and fill slopes to prevent soil erosion, sedimentation, and erosive water velocities.
13. Wind velocity reduction fences, dust control measures, and temporary and permanent stabilization measures shall be installed as necessary to protect disturbed earth surfaces from wind erosion.
14. Where subsurface water movement causes seeps, soil erosion, soil slippage, sloughing, caving, or other earth movement, the permittee shall install subsurface drainage facilities as necessary to prevent slope instability, soil erosion, and sedimentation.

#### **GENERAL CONDITIONS**

1. In issuing this permit, MCCD has relied on the information the permittee has provided in the permit application. Any changes to the current plan/permit must be submitted to MCCD for approval /inclusion in existing permit or a violation may be issued.
2. The permit shall be kept at the project site and available for inspection at all times during the project.
3. All work authorized by this permit will be done under the approved SESC plan and in compliance with all requirements of Part 91, Soil Erosion and Sedimentation Control, of the Natural Resources and Environmental Protection Act, Act No. 451 of PA of 1994, as amended, and the administrative rules.
4. The requirements of this permit will be enforced by the Marquette County Conservation District. In the event of failure to complete the work within the specified time period or failure to comply with all requirements of Part 91 of Act 451, and/or the Permit, the Conservation District may issue a notice of violation; issue a cease and desist order; seek injunctive relief; institute civil or criminal proceedings; order such work as necessary to eliminate any danger to persons or damage to property, lakes, streams, or drainage facilities; order the completion of work authorized by the permit; and/or may enter upon the land to construct, implement, and maintain soil erosion and sediment control measures, the cost of which shall be reimbursed to the Conservation District by the property owner.
5. The permit is permissive and its issuance does not convey any property rights in either real or personal property, or any exclusive privileges, nor does it authorize any injury to public or private property or any invasion of public or private rights, nor any infringement of federal, state, or local law or regulations, nor does it eliminate the necessity of obtaining such permits or approvals from other units of government as may be required by law. This permit is issued with the understanding that it does not prevent the Conservation District or the State of Michigan from the establishment of further requirements for control at any time.
6. The permittee shall immediately notify the Conservation District of any change in ownership.
7. The issuance of this permit shall not impose any liability upon the Marquette County Conservation District for damages to persons or property.
8. Permittee is responsible for requesting permit extension to cover project completion.
9. Upon a final site visit, the Conservation District will issue a Certification of Completion to close the permit out.

# INSTALLING SILT FENCE

(Hay Bales can also be used if they are packed together tightly)

1. Dig a 4"x4" trench where fence will go.  
Pile dirt in front of fence for use later.

2. Pound fence stakes in the downslope side of trench.  
Extend at least 8" of fabric into trench.  
Arrange fabric to form an "L" as shown.

2. FLAT BOTTOM TRENCH (TYPICAL)

3. If joining sections, overlap ends and twist stakes together.

4. Backfill trench to grade and compact soil to form a barrier.

1. Do not let the fabric "flap in the breeze" or lay on top of the ground. It must be trenched in below the surface to work—otherwise it is the same as not putting it up at all.

2. Try to install fence along the same grade or contour so that the runoff force is spread evenly throughout the fence. Do not funnel runoff into one area with a silt fence.

3. Check fence after rainfall to repair any blowouts or clean out if almost full.

# Soil Erosion Program

Marquette County Conservation District  
1030 Wright St., Marquette, MI 49855

## Erosion Control Ideas and Tricks To "Getting Good Grass"

1. Whenever possible, cover all raw soils with heavy seeding and a thick layer of hay mulch.
2. Use sod, crushed stone, or rock at roof dripedges to catch roof runoff. Underlay all stone/rock with filter fabric. Extend the sod/rock down the slope to a flat or wooded area.
3. Use silt fence or hay bales at your work area, especially to protect sloping land. Trench them in below grade and backfill.
4. If you can't restore the entire site in one season, get seed/hay on any areas possible before winter [even if they are not to final grade].
5. Using a thick layer of hay mulch will help to keep your topsoil from eroding, minimize gully formation, and start a temporary vegetative cover.
6. Pay attention to your soil types—clay, sand, gravel, rock, etc. A gravel/rock slope next to a lake may not need much attention, but a raw clay slope would need to be seeded/mulched immediately.
7. If you see a sedimentation problem, trace it to the source and use an appropriate solution.
8. Keep as much area as you can undisturbed adjacent to the lake/stream—this "buffer" acts as a natural sediment control.
9. Work with your contractor/excavator to leave a berm along the edge of work area or to dig a sump to catch runoff.
10. Use berms to divert roof/yard runoff away from raw fill slopes. Raw slopes will never vegetate if they have constant erosion from water going down them.
11. Steep slopes will require sod, rock, or an erosion control "blanket" for stabilization.
12. In areas of concentrated runoff or where you see gullies, a sod or fabric round bottom "ditch" will need to be used to carry water through the area.

# Erosion Control Measures Required for Projects Near a Lake/Stream

If your project is near a lake/stream, especially with a slope to the water, you are required as a permit condition to install and maintain erosion control measures upon the start of earthwork. If I am not able to visit your site before issuing the permit and instructing otherwise, please take note and install the following with your contractor/excavator:

## MINIMUM—TRENCH [can be fronted with silt fence]

Done most easily when your backhoe [bucket width] or dozer [blade up a trench and berm] is present, this is a 1' minimum below-grade trench along the entire edge of your water-facing work area.

In areas of light sand, this can also be done by hand [shovel width].

This trench is required to be cleaned out when 3/4 full and remain in place until final grade/restoration is completed. For sloping areas along the trench itself, a sediment sump [up to 5'x5'x4' deep] can be placed at the end to capture any erosion.
